Preamble of the conference

Technological development is considered one of the sources of economic growth because it means achieving production methods or improving intellectual methods that are more efficient and capable than those used, which results in an increase in production or the saving of part of the available economic resources. Technological inventions are nothing but the product of individual or collective thought by a group of individuals. Therefore, protecting the rights of this thought entails pushing this individual or these individuals to exert more effort in this field. Intellectual property rights are also considered an important means of using modern knowledge, which it leads to greater economic, cultural and social well-being.

Countries, especially developed ones, work to protect intellectual property rights in order to advance their economic progress, by granting those in charge of research and development incentive rewards in exchange for the effort they have made in this regard, and by financing and encouraging research and development activities. This protection benefits the entire community.

Global markets have now become more and more dependent on knowledge and information, and the intellectual property system plays an essential role in the process of transforming creative and innovative energy, knowledge and information into tangible economic wealth. There is also increasing recognition of the nature of the property system as an effective tool that benefits less developed countries. Also, Especially after the emergence of new intellectual rights such as computer programs, digital works, genetic engineering, and artificial intelligence. We do not deny that artificial intelligence supports innovation and is protected by intellectual property rights, as the world has recently witnessed a revolution in the field of artificial intelligence technology, as these technologies have become an integral part of Everyday life It has become recognized that artificial intelligence provides unprecedented opportunities to improve work efficiency, quality of life, and sustainable development.

Work efficiency, quality of life, and sustainable development. It is considered a key to developing the digital economy and biotechnology and achieving Innovation in many fields

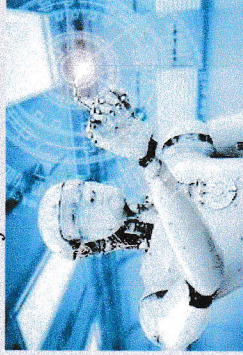

The problem of the forum

Intellectual property rights, both literary and artistic property and industrial property, are the product of the mind because they have the power to bring changes at the present time, stronger than any other previous period of time, especially with the emergence of new intellectual rights such as computer programs, digital works, artificial intelligence, and genetic engineering. Therefore, they have a direct impact on economic development and achieving effective economic growth, which results in an increase in the well-being of society.

From the above, the following problem can be raised:

To what extent do intellectual property elements contribute to achieving economic development in the light of current legal, digital and vital developments?

How effective are the legal mechanisms assigned by the intellectual property legal system to achieve the right to development in all countries of the world?

Participation form:
